

Module 02

Please, draw me a sheep!

Summary: Enough with text-based AI! Time for a more graphical approach.

Version: 3.01

Chapter I

Foreword

Deepfake images and videos are like the mischievous chameleons of the digital world, capable of morphing faces, voices, and even entire scenes with startling realism. Powered by artificial intelligence, they can superimpose anyone into a movie scene or make people say things they never actually said.

While it's undeniably fun to imagine yourself as the star of the latest action blockbuster, deepfakes come with serious implications. They blur the line between reality and fiction, making it easier to spread misinformation or manipulate public opinion.

So, while deepfakes are a fascinating showcase of AI's capabilities, they remind us to keep our critical thinking skills sharp when navigating the digital jungle!

Chapter II

Introduction

During this training, you will have the opportunity to use widely available artificial intelligence tools that you can easily reuse at home.

To access some of these tools, you will need an account. If you prefer not to use your personal email address to this purpose, we recommend creating a dedicated Gmail account for the training.

Where possible, we will provide alternatives that do not require an account. However, please be aware that this option will limit access to certain features and result in a degraded experience.

Please note that the number of requests to these AI tools can be limited, whether or not you are using an account. Depending on the tool and the intensity of your usage, restrictions could occur. In such cases, exploring alternative tools will help you continue the exercises without interruptions.

During this training, you may encounter terms or concepts that are unfamiliar to you. We encourage you to seek clarification by discussing them with your peers, researching them online, or asking the AI tools directly to enhance your understanding.

Chapter III

General objectives

The goal of this training is to familiarize you with the use of artificial intelligence tools that you can integrate into your daily life, whether in a professional or personal setting.

You will learn to leverage these technologies to optimize your work and other personal uses.

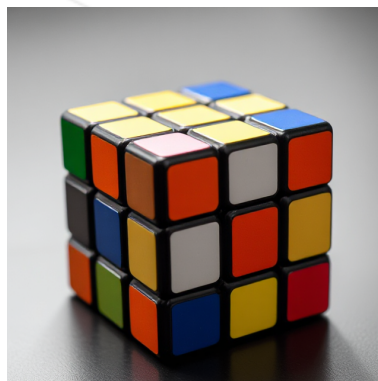

A key point of this learning is peer knowledge sharing. We strongly encourage you to engage, ask questions, and share your discoveries with other participants throughout the training and during the peer evaluations.

Chapter IV

Exercise 00: Choose your AI to generate images

In Module 00 - Ex01, you chose your LLM. Now you will need to choose an AI that generates images.

- Explore the available AIs that generate images. Here are some examples: DALL-E, Midjourney, Pixlr, DeepAI, Dream Lab in Canva, and more. You can use search engines (such as Google, Bing, etc.) or text-based AIs (like ChatGPT, DeepSeek, etc.) to discover other options.
- Create the submission file to store your answers, following the same structure as in previous modules.
- As your response for this exercise “Ex00”, provide the full URL of the AI you will be using in this module.
- Generate your first image, using a simple prompt (e.g.: “a Rubik’s Cube”, “a car”, whatever you want). Save the image for evaluation and include the prompt you used in your submission file.

Chapter V

Exercise 01: Draw me a sheep!

In the book “The Little Prince” by Antoine de Saint-Exupéry, the little prince asks the narrator to draw him a sheep.

All the proposed drawings are rejected by the little prince, until the narrator draws a box and tells him that the sheep is inside.

Now it’s your turn to draw a sheep.

You can use the AI you chose in the previous exercise to generate an image that represents this part of the story, with the box containing the sheep. Let’s see how the AI interprets this.

The first answer for this exercise is the prompt you used to generate the image. It will be reproduced during the evaluation.

It is interesting to note that even if you explicitly ask a closed box with a sheep inside, the AI may not be able to represent it as you expect, and the box will likely be open.

The second and third answers are two variants of the same prompt, generating the image in a *cartoon* style and a *pop-art* style, respectively.

You should have three answers for this exercise.

Chapter VI

Exercise 02: Images for a presentation

In Module 01, you asked the AI to generate the text content for a presentation about neural networks in computer science.

Now it's time to generate images that will illustrate your slides. You should use different images for each slide, each related to a specific part of the topic.

Simple prompts may not work any longer. You will probably need to add many details and specifications about the look and feel you are trying to achieve for each image.

You can include multiple prompt lines in your submission file.

Bonus: You can choose whether to complete this task. Using a traditional slide editor(e.g., PowerPoint, Google Slides, Keynote, etc.) combine the text created by the AI in Module 01 with these images to create your complete presentation.

Exercise 03: Logo for your company

- Experiment with several slogans generated by the AI.
- Try to design a logo that reflects the company's core purpose.
- You may need to provide specific instructions, such as requiring a white background, limiting the number of colors, using geometric shapes, etc.

Chapter VIII

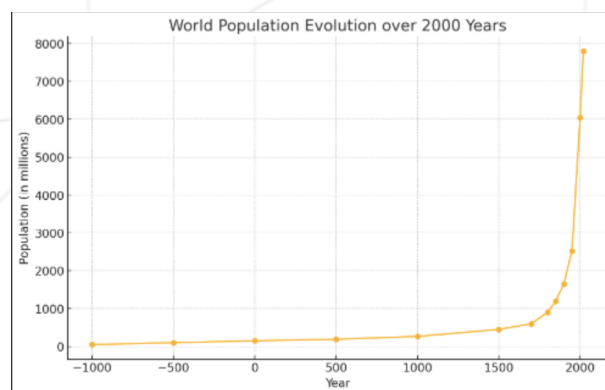

Exercise 04: Chart of the world population

Generate a chart that illustrates the evolution of the global population over the last 2000 years.

What kind of result do you get from your AI that generates images? How suitable is it for a formal presentation?

You may need to explore alternative solutions. Did you know that some text-based AIs are capable of creating such charts?

In your submission file, include your best but unsuccessful prompt with the image-generating AI, followed by your prompt and the AI used to achieve a correct result.

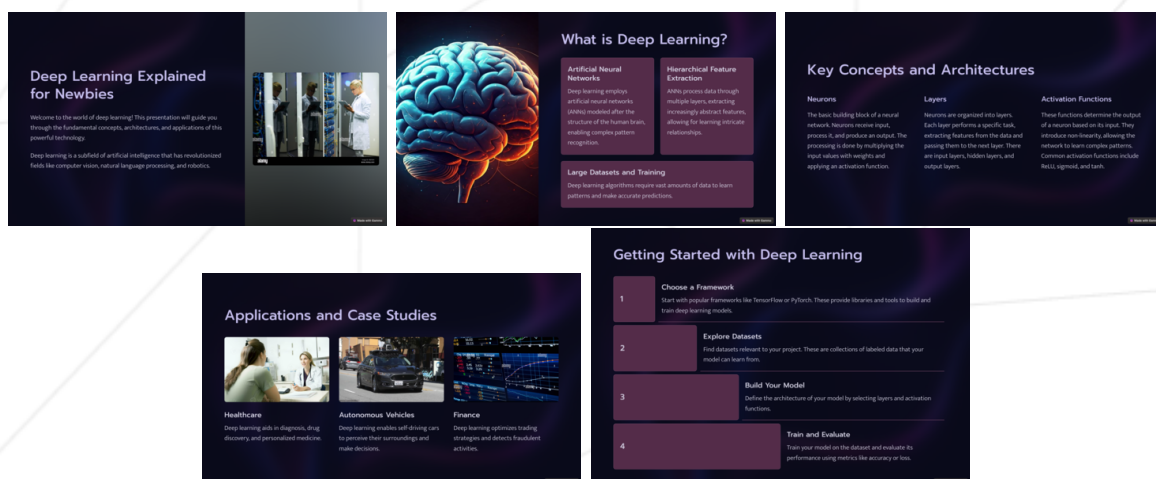

Chapter IX

Exercise 05: Slides generation

Some specialized AIs are capable of directly creating slides for your presentation, combining both text and images, combined into multiple slides.

- Explore the available AIs that generate slides. We trust that you can now find these websites on your own.
- Use the same topic from the previous module: slides explaining deep learning to people without prior knowledge.
- Generate the slides and download them as a PPT or PDF file. Include in the turn-in file the name of the downloaded PDF/PPT file, the AI you used, and, if applicable, the prompts you used.

Chapter X

Exercise 06: Do you need some help?

The various AIs we have encountered so far can achieve many tasks for us, but that's not always the case. However, even they can't directly complete task, they can often provide an efficient step-by-step guide.

In this exercise, you will create your very first *static web page*, stored locally on the computer, even if you have no prior experience with web development.

Your objective is to achieve the following result:

- in your web browser (Chrome, Firefox, etc.), you should be able to display a web page contained in a *.html* file stored locally on your computer (instead of loading a web page from the Internet).

You will need to interact with multiple AIs several times to complete this task.

A good first step would be asking an AI for a complete process (or guide) on how to do it and experimenting with the steps provided.

Some parts of this guide may require follow-up questions to fully understand each step.

Ask the AI for very simple content for the web page, such as a title and a brief block of text.

Remember, in Peer-Learning, you are encouraged to collaborate with your peers and embrace failure as part of the learning process!

In your submission file, provide the name of the *.html* file on your disk that contains your web page. During the evaluation, you will share your experience and challenges in reaching the target.

Chapter XI

Exercise 07: A little bit further

Now that you know how to create a simple web page, it's time to improve its content!

First, create a copy of the file from Exercise 06 so that you have an untouched version for evaluation and a second version to update for this exercise.

The updated web page must meet the following requirements:

- The web page serves as an advertisement for a training session on the dangers of AI, taking place next week in your neighborhood.
- The page includes a preview of the training session's content.
- The page features at least one image (more are allowed).
- The page displays texts in various sizes and colors.

Aim to design a web page with an appealing and polished look!

In your submission file, provide the new name (different from Exercise 06) of the *.html* file on disk containing your updated web page.

Chapter XII

Exercise 08: A little of complexity

Generate an image with the following characteristics:

- The image should depict a red cat with blue eyes.
- The full body of the cat should be visible.
- The cat is lying on a green blanket, on top of a bed.
- The full bed should be visible.

In your submission file, submit the prompt you used to generate the image. The image will be reproduced during the evaluation.

You may need to explore tutorials and documentation to create a suitable prompt to achieve the desired result.

2

Not all image-generation AIs perform equally well, so the same prompt may produce different results depending on the AI you use.
